Finding the balance between following OEM oil change recommendations and your opinion on when to change oil may be difficult to navigate. Add in budget constraints and unforeseeable expenses and the decision process is even trickier. So, does anyone really know the correct answer for when a truck's oil needs to be changed? [U.S. Lubricants](#) has two reliable solutions that have been used for over 65 years to help our customers feel confident about drain interval maintenance and education.

Participating in our [OilChek®](#) Oil Analysis Program is a great first solution. With several variables impacting the life of your truck, such as type of driving, weather conditions, and engine type, establishing when your truck requires an oil change can result in large savings. Our customers who have chosen to participate in our oil analysis program have seen incredible results. In fact, one of our customers almost doubled their mileage between drain intervals, saving time and money.

Another great solution is working with one of our heavy-duty specialists to tailor a product mix specific to your fleet. We listen to your needs and offer customized solutions that will allow you to extend drain intervals, lower costs, and increase the longevity of your fleet.
